Reloaded PC/Laptop Notes September 2011

Your reloaded PC or Laptop will behave as a “new” machine, i.e.: it won't have your printer drivers installed, nor will it have camera's webcams etc installed. These must be done after you have connected the Internet back up. It will however be fully set up with all the latest Windows Updates and protected from viruses.

- Connect to broadband router, *no need to install software* just plug in to router or connect via wireless using your WEP/WPA key.
- **Do Not plug-in any USB devices** until the drivers for the device have been installed, e.g.: printers, scanners etc.
Use your CD supplied with the device e.g.: printer driver CD or download from the manufacturers web site, e.g.: Google **HP Support**
- Set up your desktop display resolution (Personalise Display Settings in Win 7) Desktop Properties, Settings in XP) usually set them to max resolution for best display.
- We have installed **Microsoft Security Essentials** to protect your computer, to change the scan schedule, open **MSE** and click Settings, change the scan time to a time when the computer is likely to be switched on.
(You will find **MSE** near the clock on the bottom task bar). 
- Ensure that Antivirus software is updated & scanned every week.
- Best advice to keep the computer fast is to only install the applications you need, avoid unnecessary utilities.
- Microsoft Security Updates should be installed whenever prompted. (Icon appears on the taskbar near the clock, text will appear “There are updates for your computer”. You should follow the instructions to install) you can often install the updates when you shut down the PC/Laptop.
